

Contents

I.	General introduction	1
II.	A detailed study on the effects of noise on speech intelligibility	5
2.1	SIGNAL PROCESSING	8
2.1.1	Signal analysis: the three noise effects	9
2.1.2	Signal analysis and resynthesis for the listening experiments	11
2.2	MEASUREMENTS	14
2.3	DISCUSSION	15
2.3.1	The MTF and the STI model	15
2.3.2	Spectral subtraction and the second noise effect	17
2.4	CONCLUSIONS	21
III.	The concept of signal-to-noise ratio in the modulation domain and speech intelligibility	23
3.1	RATIONALE AND INTRODUCTION OF $(S/N)_{\text{MOD}}$	25
3.1.1	Speech envelopes and the concept of the useful modulation area	25
3.1.2	Spectral subtraction and the modulation floor	28
3.1.3	Concept of $(S/N)_{\text{MOD}}$, the signal-to-noise ratio in the modulation domain	32
3.2	VERIFICATION OF THE RELEVANCE OF $(S/N)_{\text{MOD}}$	36
3.2.1	Spectral subtraction and speech intelligibility	37
3.2.2	Deterministic and noise induced modulation reduction	37
3.2.3	Compression and expansion of noisy speech	40
3.3	DISCUSSION	42
3.3.1	STI and intelligibility of noisy speech	44
3.4	CONCLUSIONS	44
IV.	The effect of varying the signal-to-noise ratio in the modulation domain on speech intelligibility in noise	47
4.1	DEFINING THE PROBE SIGNAL FOR ESTIMATING THE MODULATION RATIO	51
4.2	MANIPULATING THE MODULATION RATIO USING THE NOISE-FREE SIGNAL	56
4.2.1	Manipulating the modulation ratio for the speech-matched probe	56
4.2.2	Application to speech-plus-noise signals	58
4.3	MANIPULATING THE MODULATION RATIO WITHOUT USING A <i>PRIORI</i> KNOWLEDGE	60
4.3.1	Manipulating the modulation ratio for the speech-matched probe	60
4.3.2	Application to speech-plus-noise signals	61
4.4	DISCUSSION	66
4.5	CONCLUSIONS	70
