Risk factors for arm-wrist-hand and neck-shoulder symptoms among office workers

Stefan Ijmker

**Stefan Ijmker**

In this thesis the dose-response relationship is investigated between the duration of computer use at work and the onset of arm-wrist-hand and neck-shoulder symptoms among a cohort of office workers in the Netherlands. In addition, the relative contribution of risk factors related to work exposure, leisure time exposure and individual characteristics for the onset of arm-wrist-hand and neck-shoulder symptoms is determined.
