

CONTENT

General introduction and outline of the thesis	9
Part 1	
Pathophysiology of impaired glucose metabolism	
Pancreatic steatosis in humans: cause or marker of lipotoxicity?	19
Ectopic fat storage in the pancreas, liver and abdominal fat depots: impact on beta-cell function in individuals with impaired glucose metabolism	37
Impaired insulin sensitivity is accompanied by disturbances in skeletal muscle fatty acid handling in subjects with impaired glucose metabolism	55
Part 2	
The role of the renin-angiotensin system	
Does interference with the renin-angiotensin system protect against diabetes? Evidence and mechanisms	73
Valsartan improves beta-cell function and insulin sensitivity in subjects with impaired glucose metabolism: a randomized, controlled trial	99
Valsartan-induced improvement of insulin sensitivity is not paralleled by changes in microvascular function in individuals with impaired glucose metabolism	115
Long-term treatment with the angiotensin receptor blocker valsartan improves adipose tissue function in normotensive subjects with impaired glucose metabolism	133
The effect of the angiotensin receptor blocker valsartan on body composition and fat distribution in individuals with impaired glucose metabolism	153
Discussion and future perspectives	163
APPENDICES	
Samenvatting en toekomstperspectieven	186
